

A BACKUP THAT IS NOT MONITORED IS NOT A BACKUP YOU CAN COUNT ON

Your data is the lifeblood of your company. Statistics show that companies that have total data loss due to a computer failure go out of business within 6 months.

There are three critical requirements to protect your data from computer crashes and viruses like Ransomware.

Your data backup up must be monitored.

Even if you have an automated backup, if it is not monitored every day to make sure the backup happened you do not have a reliable backup. There is nothing quite as heart-breaking as trying to recover from data loss to find your last backup was six months ago.

Retention

Retention is the number of days you can go back. If you only have one backup and you backup every day, then every night you overwrite your existing backup. So if you have corrupted data today, tonight's backup will ensure that your backup will contain corrupted data tomorrow.

Cloud Backup

Your first line of defense is an on premise backup. This is easy and fast to get to and data recovery is fast as it does not have to be downloaded from the cloud. But having a copy of your backup stored in the cloud protects you against Fire, Theft and Flood and lets you sleep at night secure in the knowledge your data is safe.

Our solution covers all of the bases at an affordable price.

Protect your business against catastrophic data loss. It's the best insurance you can buy.
